All integrated optical components and devices make use of "waveguides", where light is confined by total internal reflection. The elements in such "photonic chip" are interconnected through waveguides, and also the integrated optics components themselves are fabricated using waveguide configuration, such as couplers, switches, modulators, multiplexors, amplifiers and lasers, etc. These components are integrated in a single substrate, thus resulting in a compact and robust photonic device, which can be optically connected through optical fibres. With and increase in the number of integrated optical components and devices emerging from the research laboratories to the market place an up-to-date book is essential in collecting, summarizing and presenting the new developed photonic devices. This includes fundamental aspects, technical aspects (such as fabrication techniques and materials) and characterisation and performance. This is an advanced text aimed at specialists in the field of photonics, but who may be new to the field of integrated photonics. The fundamental aspects have been carefully considered, and all the topics covered by the book start at a medium level, making it highly relevant for undergraduate and post-graduate students following this discipline.

When I was 14, I obtained my first official paid job at a local McDonald’s in southern New York, and I have been employed ever since. As a low-income, blue collar, prospective first-generation college student, my career imaginings were limited by the world around me, but my will to succeed and my supporters allowed me to flourish in life and work. Years later, having graduated college and nearing completion on my Master's degree, I look back on my own career development with much amazement. I see obstacles overcome, blessings provided, the support of incredible people and I know that my success was no accident.
